

Process Overview Visualization

Project/Assignment Decisions

Game direction and mechanics (Anna + Alexander):

- Implementation of game iteration changes from A2, compromising between the current game state and improving player understanding.
- Revamping UI design, moving towards a more cartoony aesthetic to keep in line with the rest of the game's visuals.
- Choosing between multiple options for additional mechanics like alternative package types, multiple package recipients and post offices, or terrain types. Icy terrain was chosen which changes how the player must navigate the level and protect the package.

Sound, Image direction and feeling (Anna + Clarissa):

- Choosing sounds that reflecting the natural environment that game was set in.
- Finding and editing sounds and music in order to create background track that helped further enhance the environment.
- Editing the box falling noise to be less jarring, following some feedback from Anna.
- Finding and editing sound effects (level complete, walking in grass, ambience, etc...)

- Rejecting sound effects that did not enhance or add to the game.
- Making each package have the same design instead of cycling through several different box designs.
- Adding in different styles of houses to incorporate some variety.
- Created a new background for a winter level.
- Added a new animation frame for jump animation.
- Added new signage for movement tutorial.
-

Role-Based Process Evidence

Name: Alexander Hernandez Pineda

Role(s): Lead Programmer, Level Design Support

Primary responsibility for this work: Implement iteration changes and additional mechanics

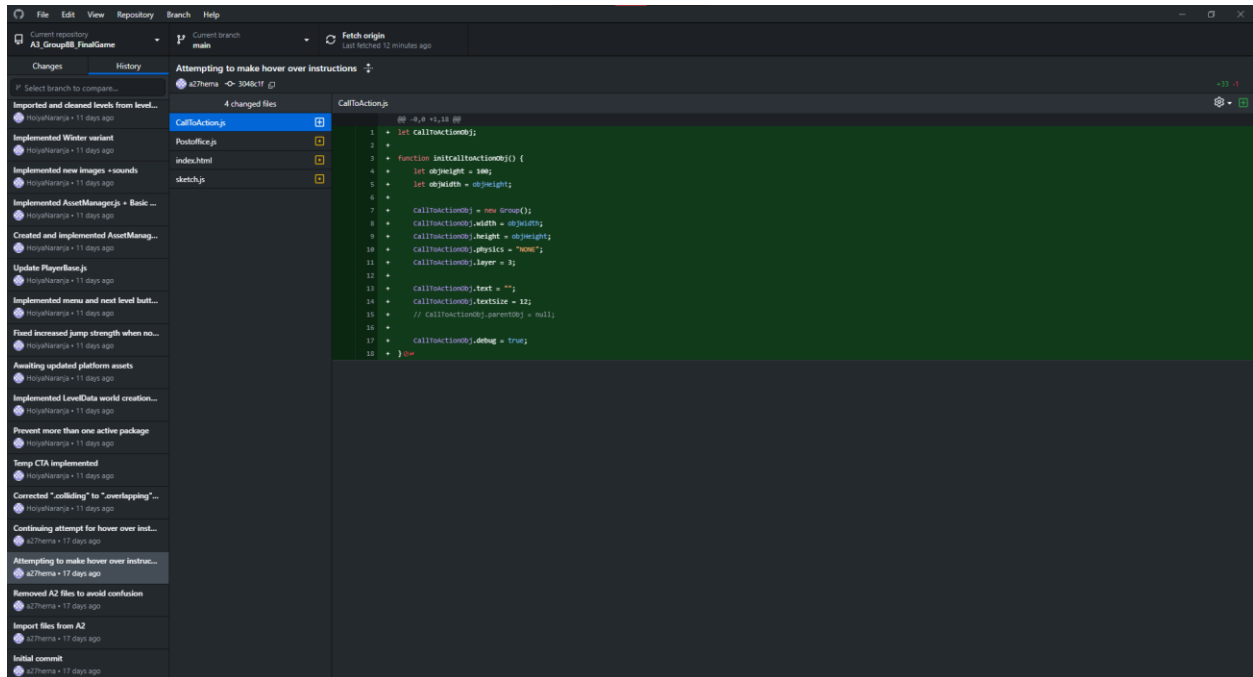

Goal of Work Session:

- Add underlying functionality to support iteration changes and improve gameplay
- Keep code modular and fairly clean so that others are able to contribute without many barriers
- Implement additional mechanics (icy terrain, hover over instructions, level visual theme)

Tools, Resources, or Inputs Used:

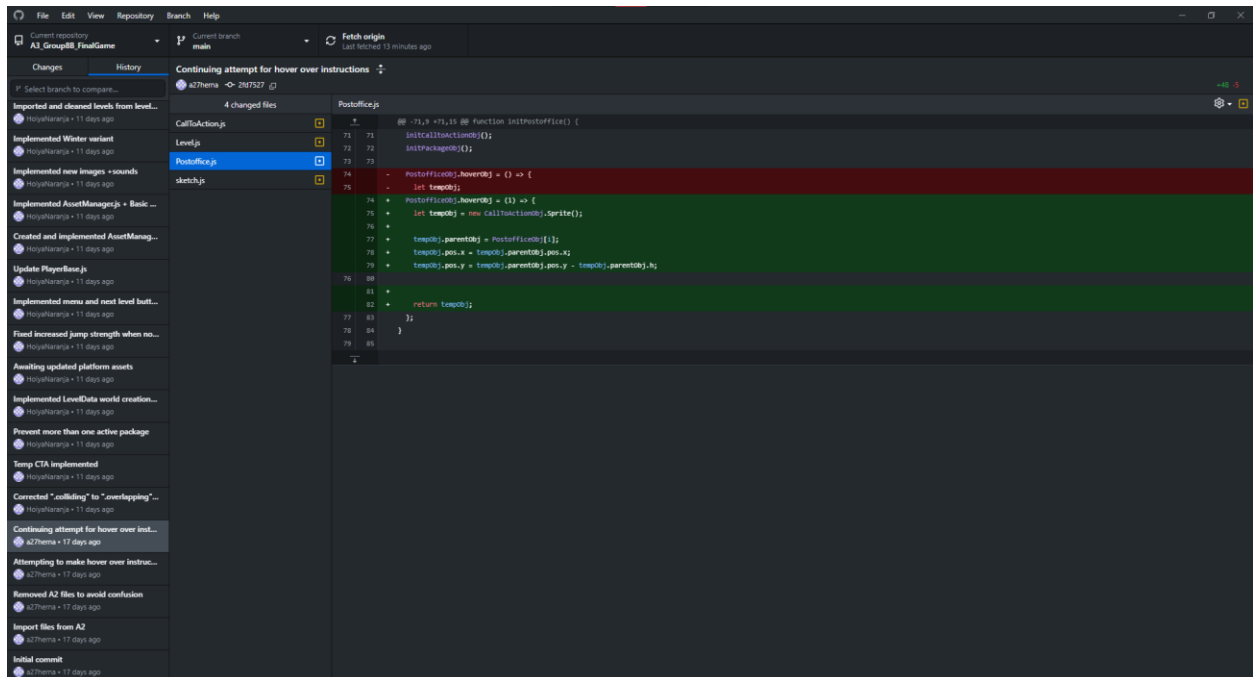

- Visual Studio Code
- GitHub Desktop
- Web Browser
- Team feedback (Anna - asset implementation, Clarissa - asset implementation, All - general quality checks)

Create basis of Call To Action (CTA) sprite group. Created by parent objects:

The screenshot shows the VS Code editor with the 'CallToAction.js' file open. The file is part of the 'CallToAction.js' group. The code defines a 'CallToAction' class with a 'new' method and a 'destroy' method. The 'new' method creates a new 'CallToAction' object and returns it. The 'destroy' method removes the object from the 'CallToAction' group.

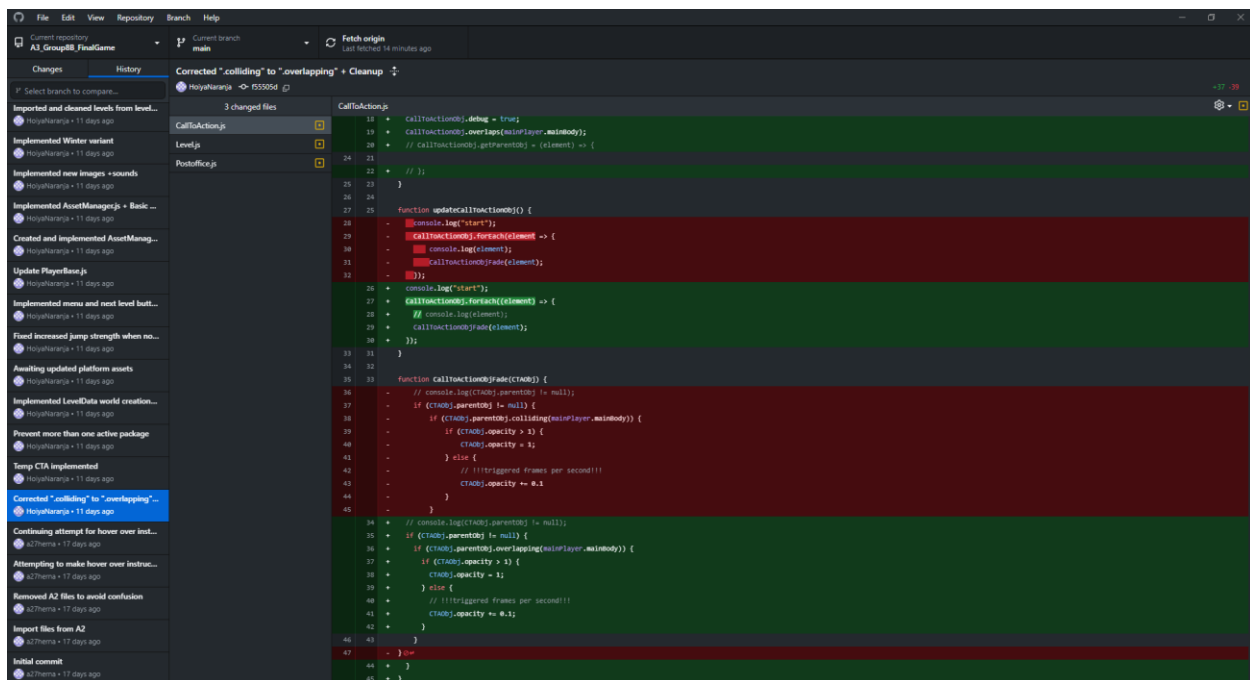

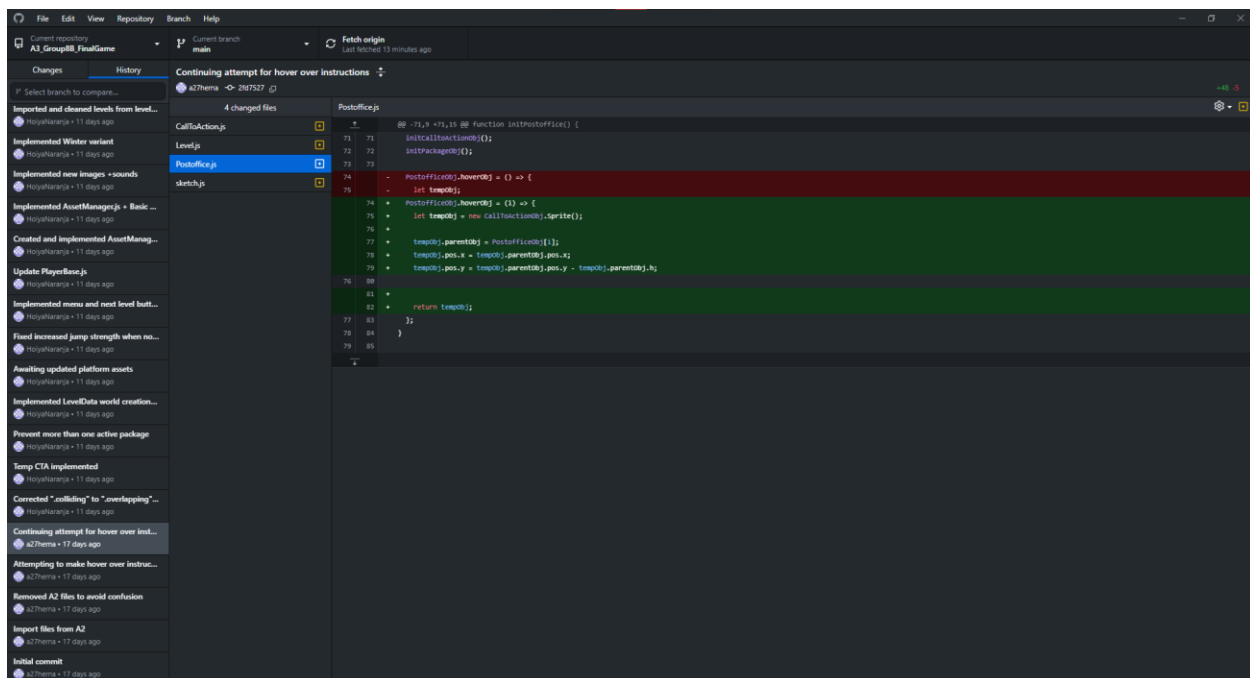

```
1  * let CallToActionObj;
2  *
3  * function initCallToActionObj() {
4  *   let objWeight = 100;
5  *   let objWidth = objWeight;
6  *
7  *   CallToActionObj = new Group();
8  *   CallToActionObj.width = objWidth;
9  *   CallToActionObj.height = objWeight;
10 *   CallToActionObj.physics = "none";
11 *   CallToActionObj.layer = 3;
12 *
13 *   CallToActionObj.text = "";
14 *   CallToActionObj.textsize = 12;
15 *   // CallToActionObj.parentObj = null;
16 *
17 *   CallToActionObj.debug = true;
18 * }
19 *
```

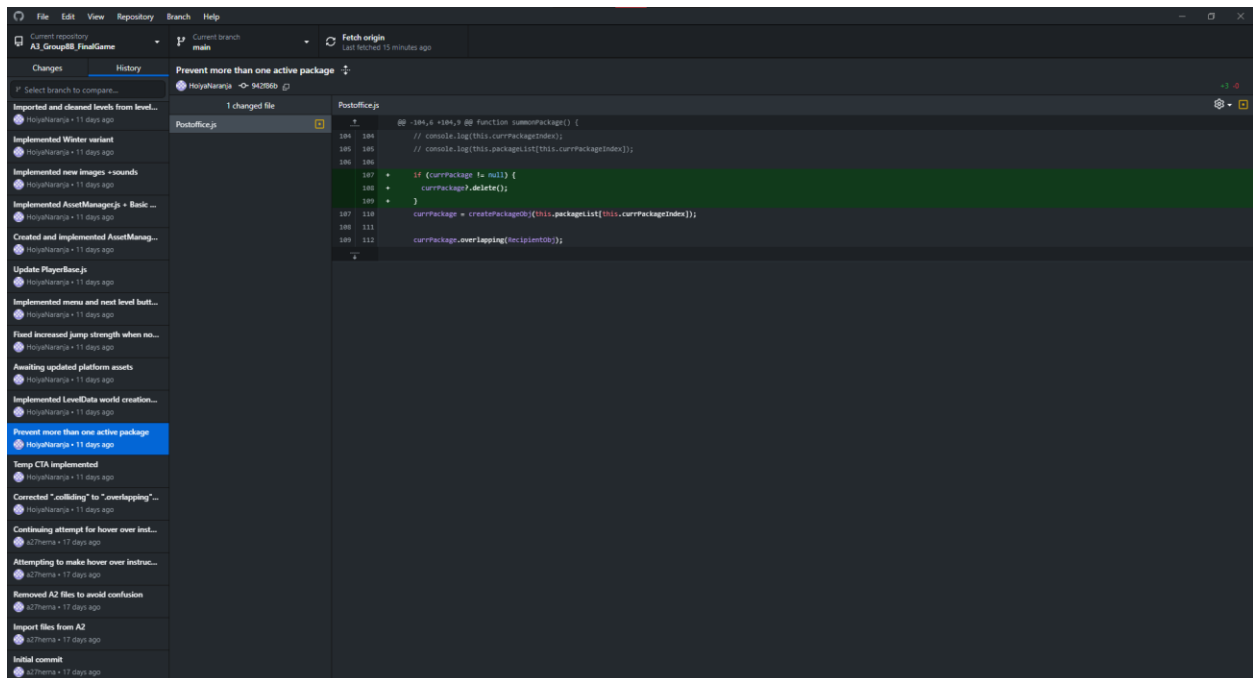

The screenshot shows the VS Code editor with the 'PostOffice.js' file open. The file is part of the 'PostOffice.js' group. The code defines a 'PostOffice' class with a 'new' method and a 'destroy' method. The 'new' method creates a new 'PostOffice' object and returns it. The 'destroy' method removes the object from the 'PostOffice' group.

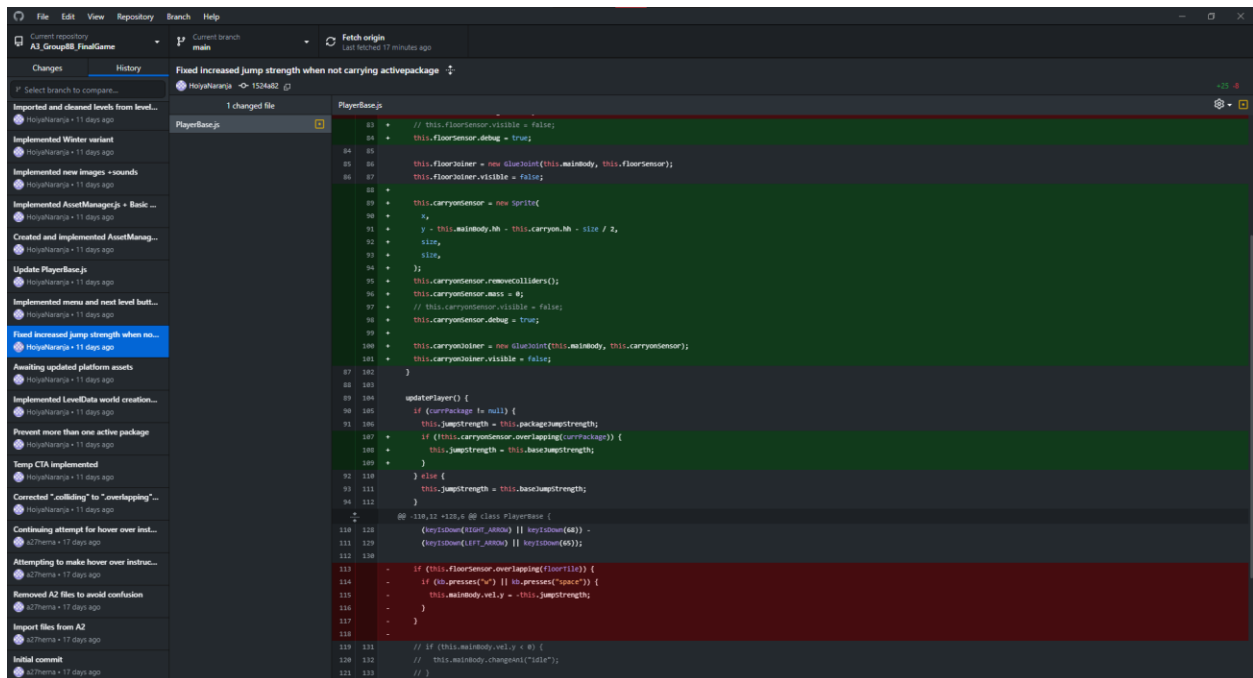

```
1  * let PostOfficeObj;
2  *
3  * function initPostOfficeObj() {
4  *   let objWeight = 100;
5  *   let objWidth = objWeight;
6  *
7  *   PostOfficeObj = new Group();
8  *   PostOfficeObj.width = objWidth;
9  *   PostOfficeObj.height = objWeight;
10 *   PostOfficeObj.physics = "none";
11 *   PostOfficeObj.layer = 3;
12 *
13 *   PostOfficeObj.text = "";
14 *   PostOfficeObj.textsize = 12;
15 *   // PostOfficeObj.parentObj = null;
16 *
17 *   PostOfficeObj.debug = true;
18 * }
19 *
```

Implement CTA object fade-in and out:

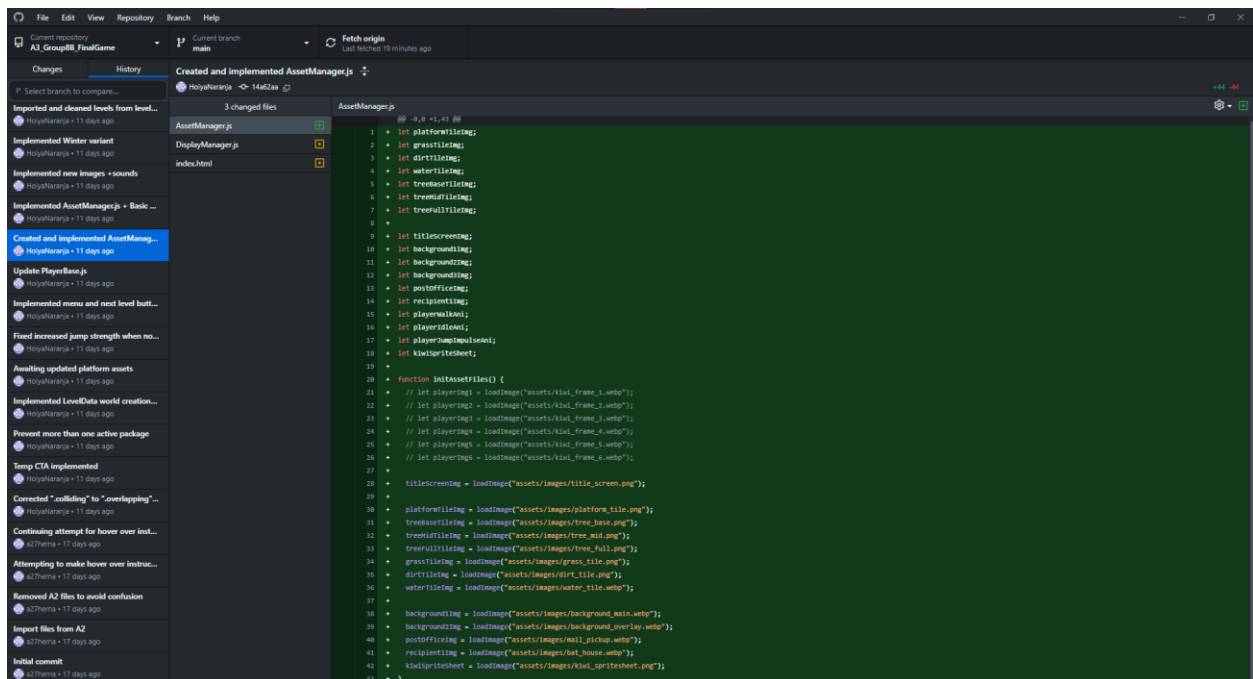

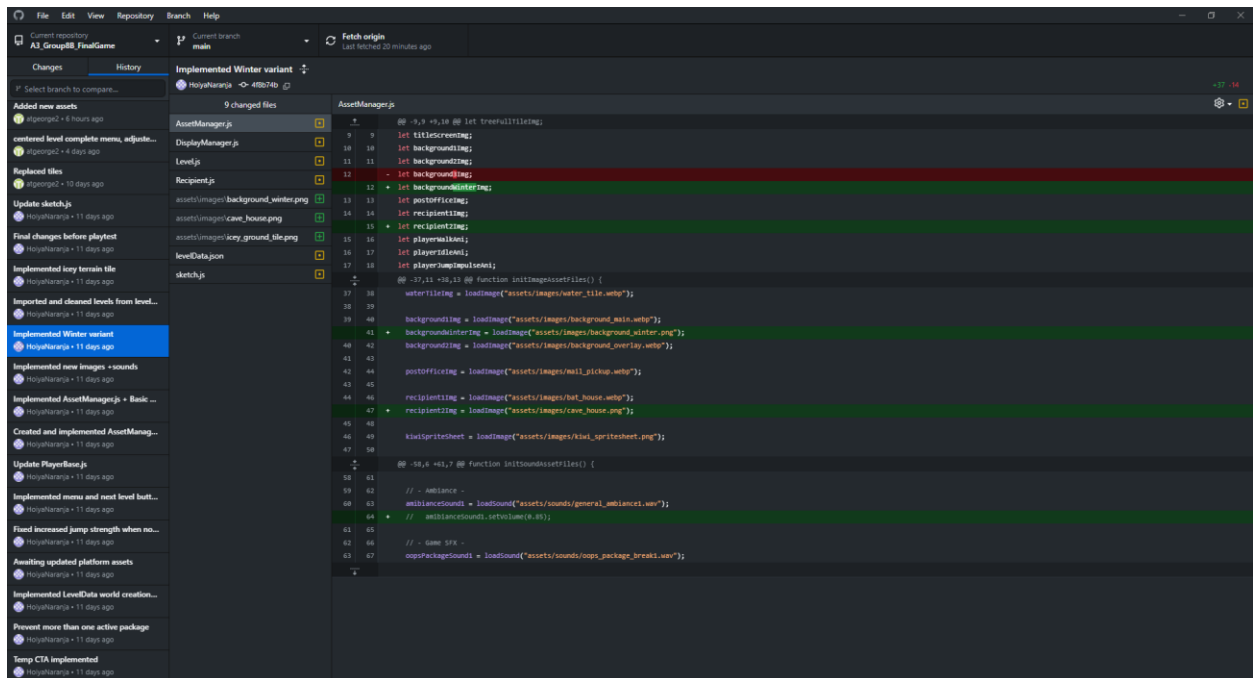

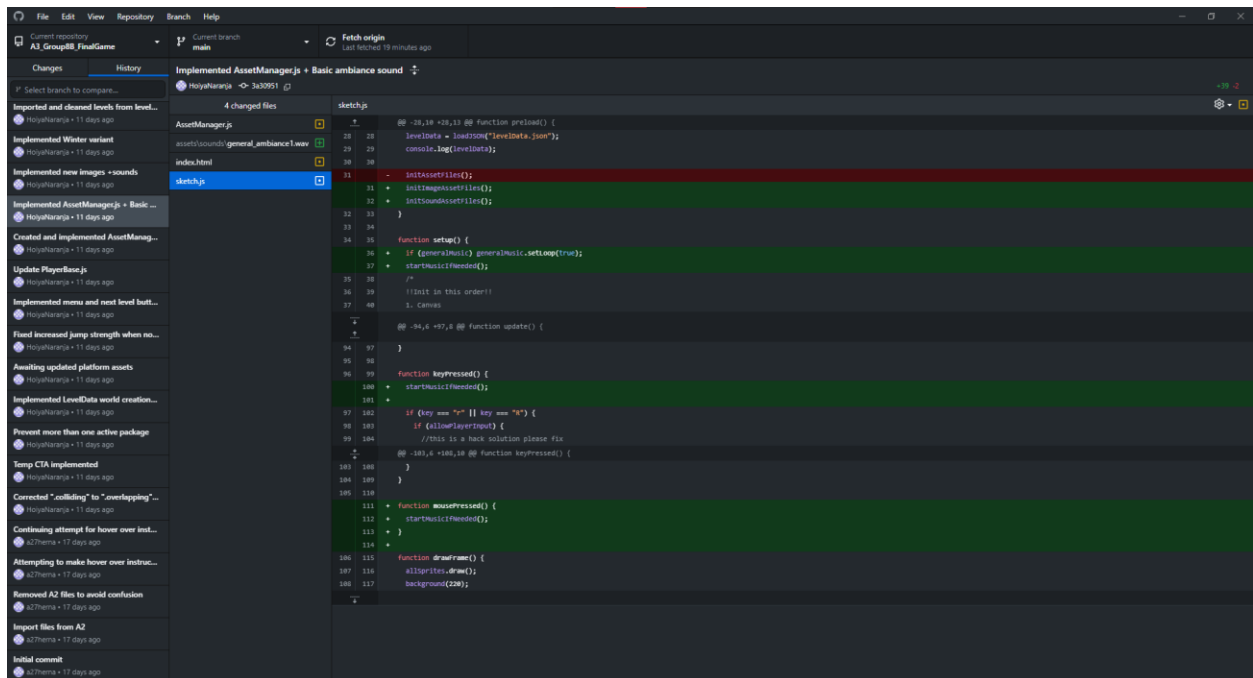

Prevent excess package creation:

Implementing support for audio and further images:

Implemented new icy terrain tile:

Name: Anna George

Role(s): Project manager + UI design, art + coding assistant

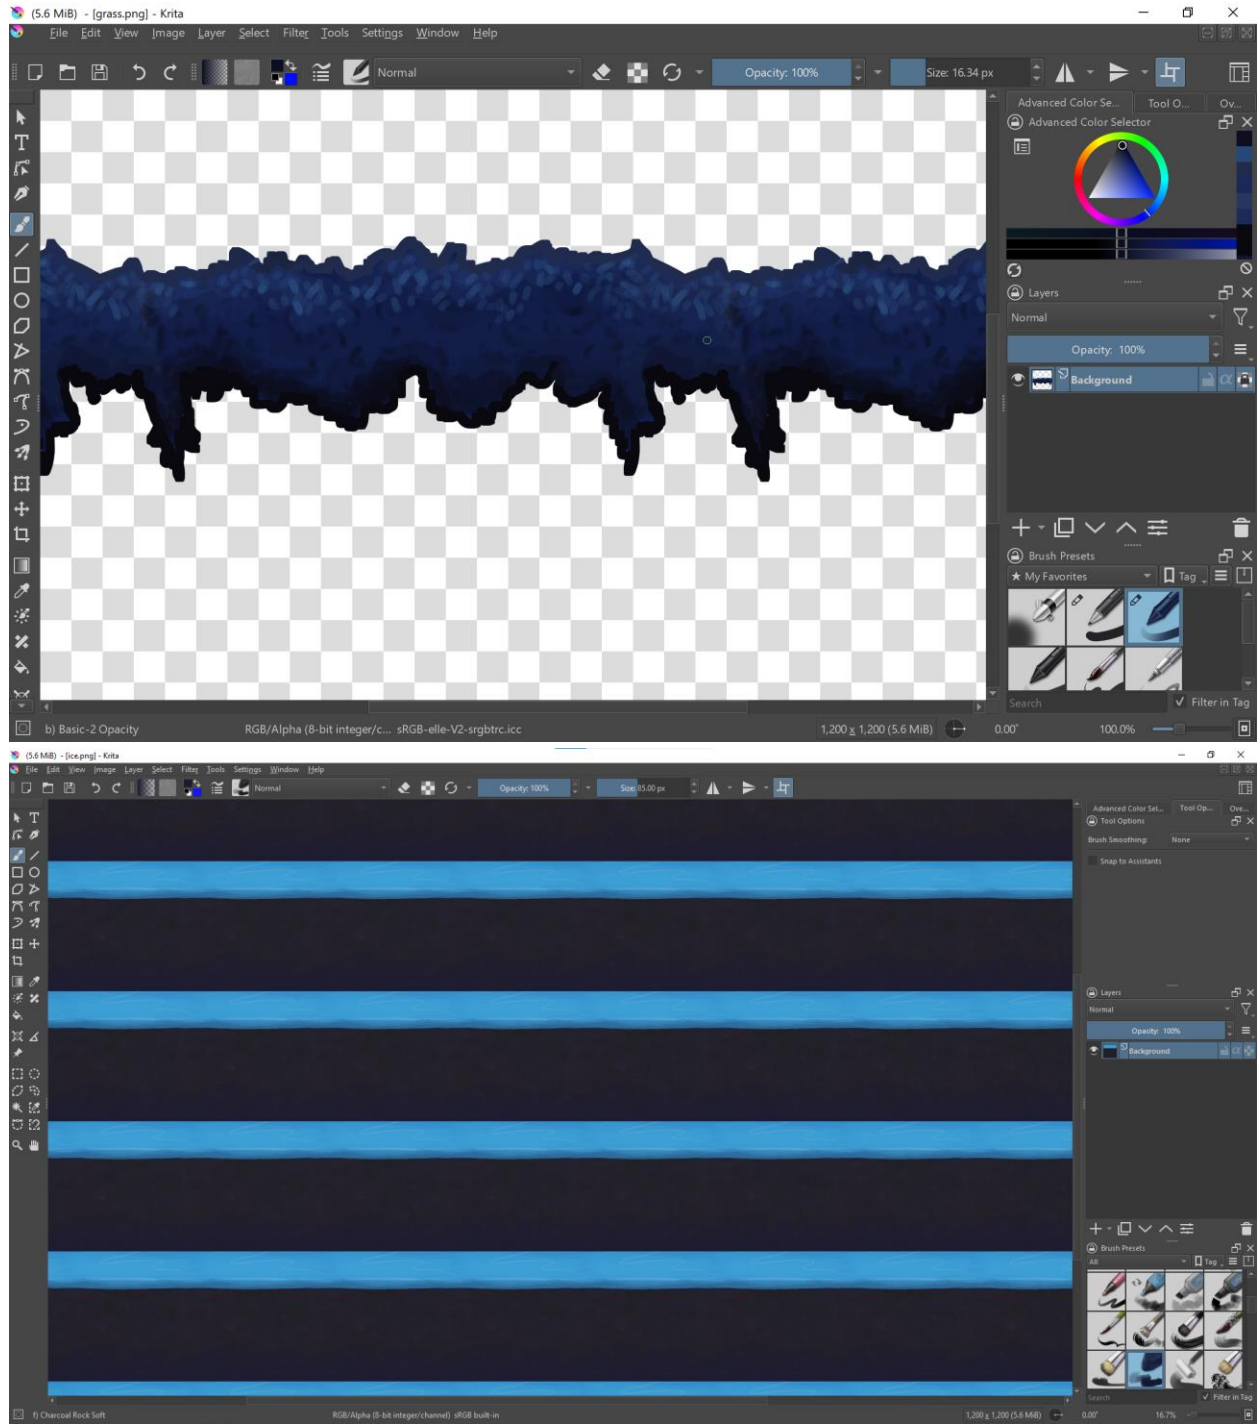

Primary responsibility for this work: Coordinating teammates, documentation, helping teammates

Goal of Work Session:

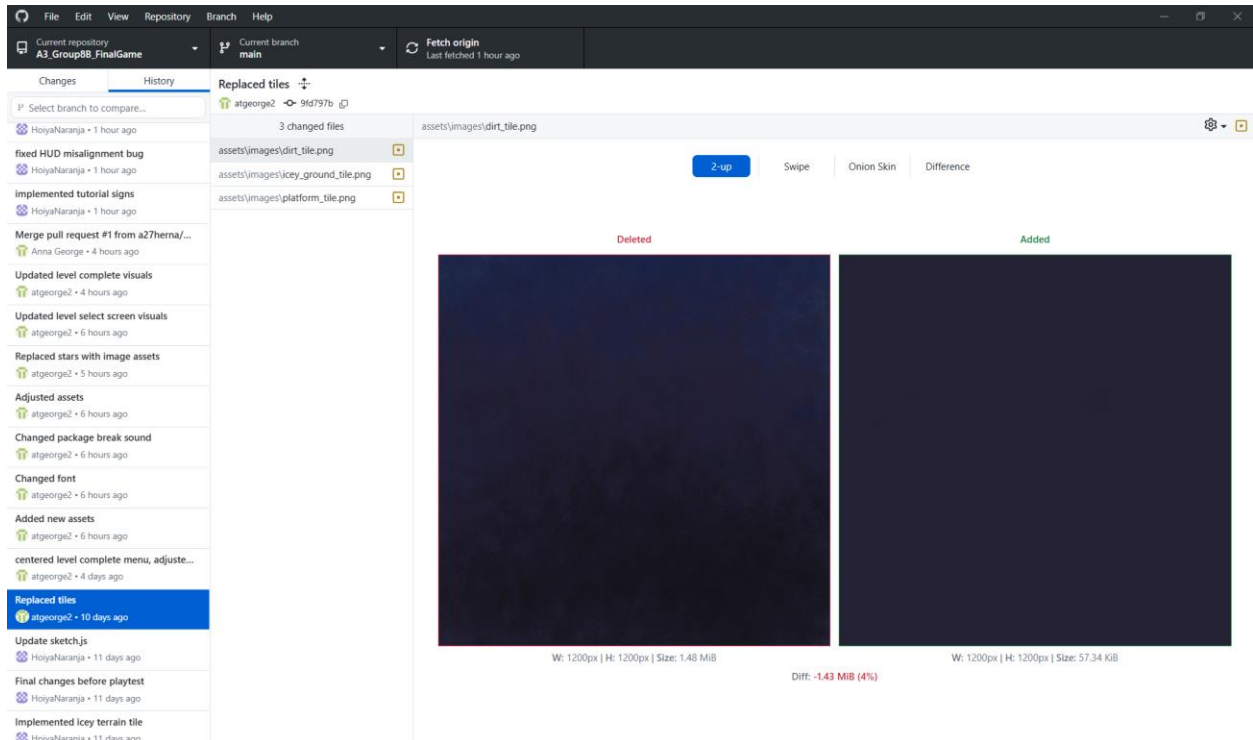

- Scheduling, monitoring project progress, coordinating teammates
- UI design
- Iteration notes
- Implementing feedback

Tools, Resources, or Inputs Used:

- Word
- Discord
- Figma
- Clip Studio Paint
- Krita
- Visual Studio Code
- Group feedback (from group discussions)
- Group notes (from brainstorming session)
- Playtesting feedback
- Alex's code
- Clarissa's art
- Freesound.org
- Sketchbook App
- DaVinci Resolve

Editing all tile assets (made by Clarissa) to be tileable using wrap-around mode

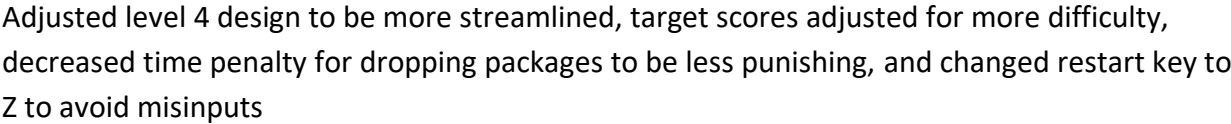

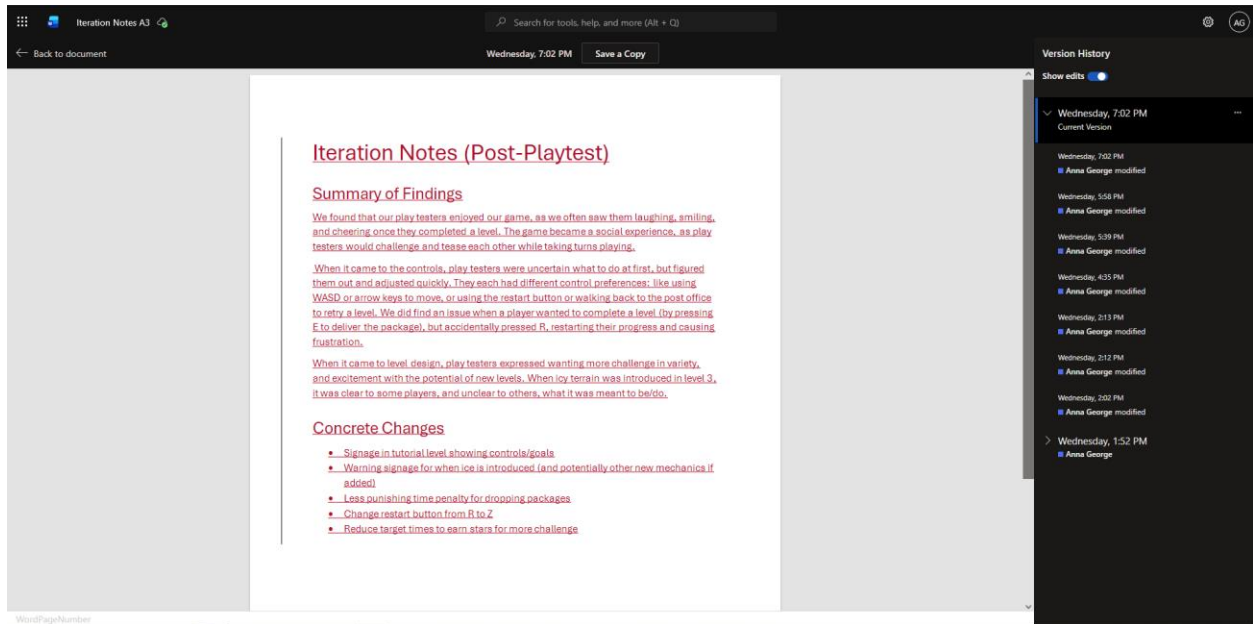

Replaced tile assets

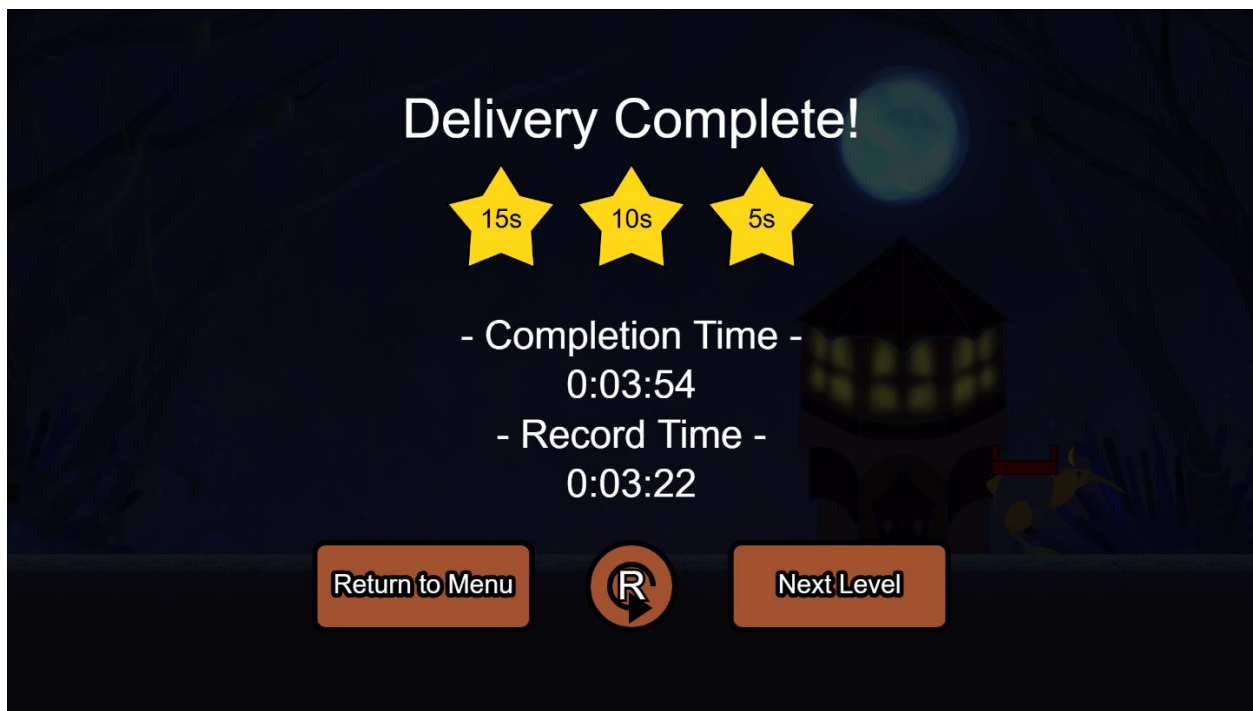

Rough UI planning

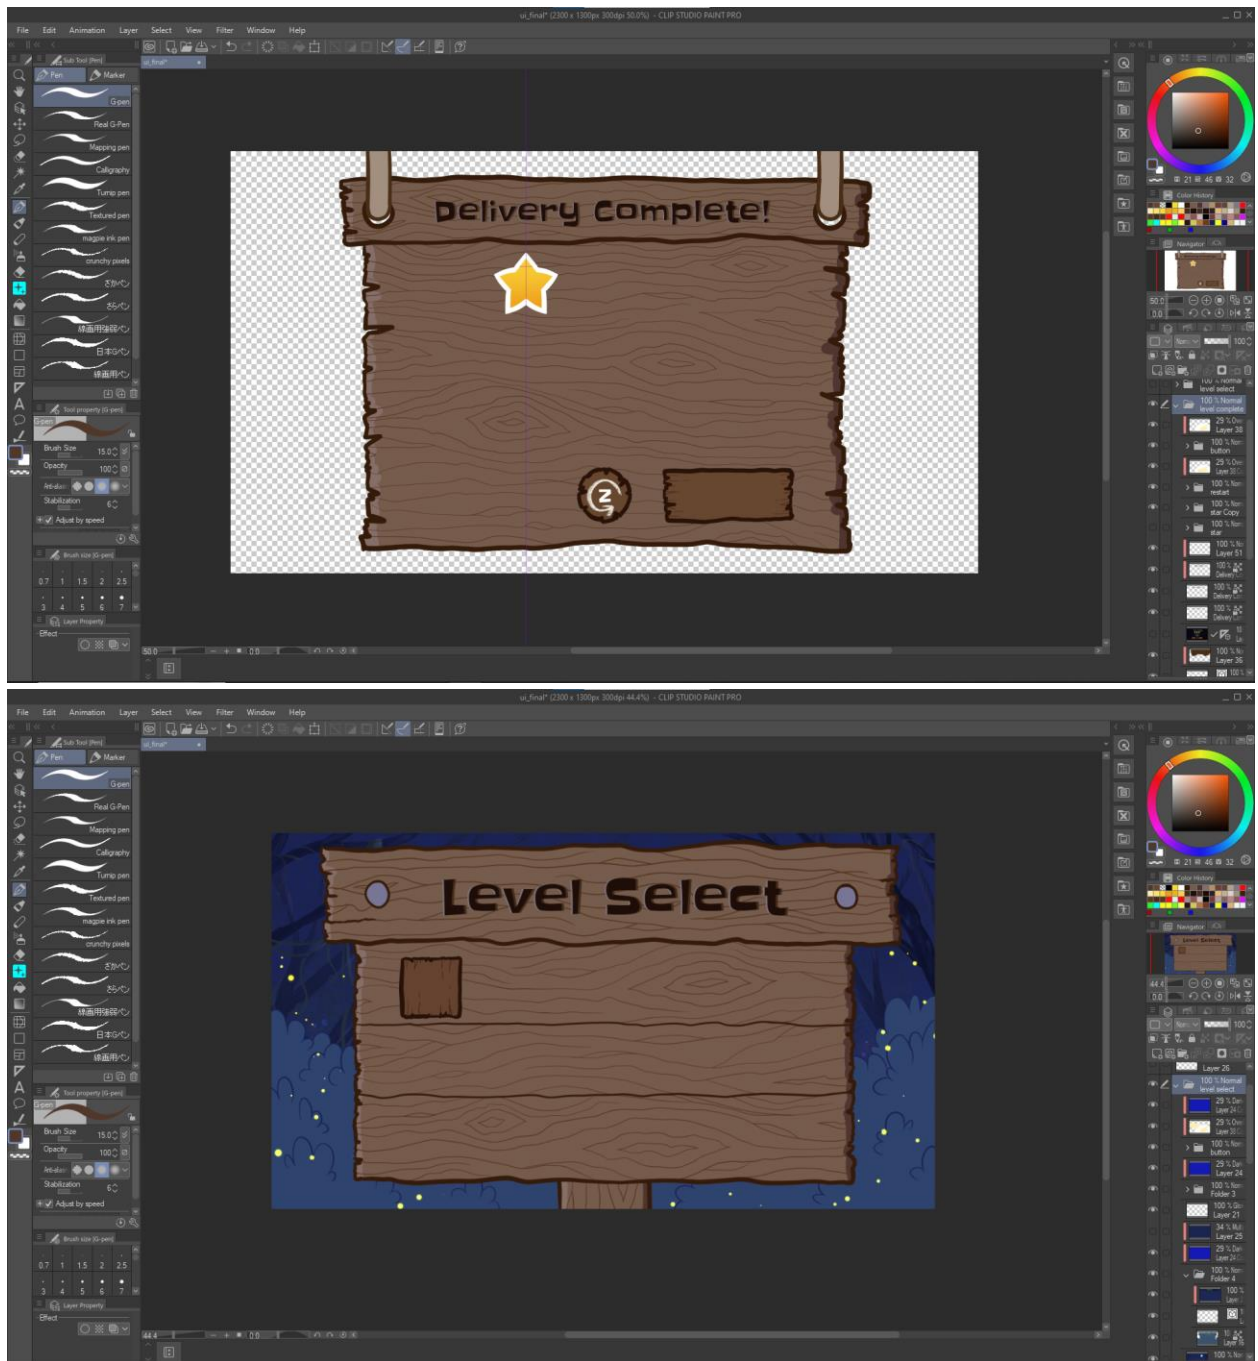

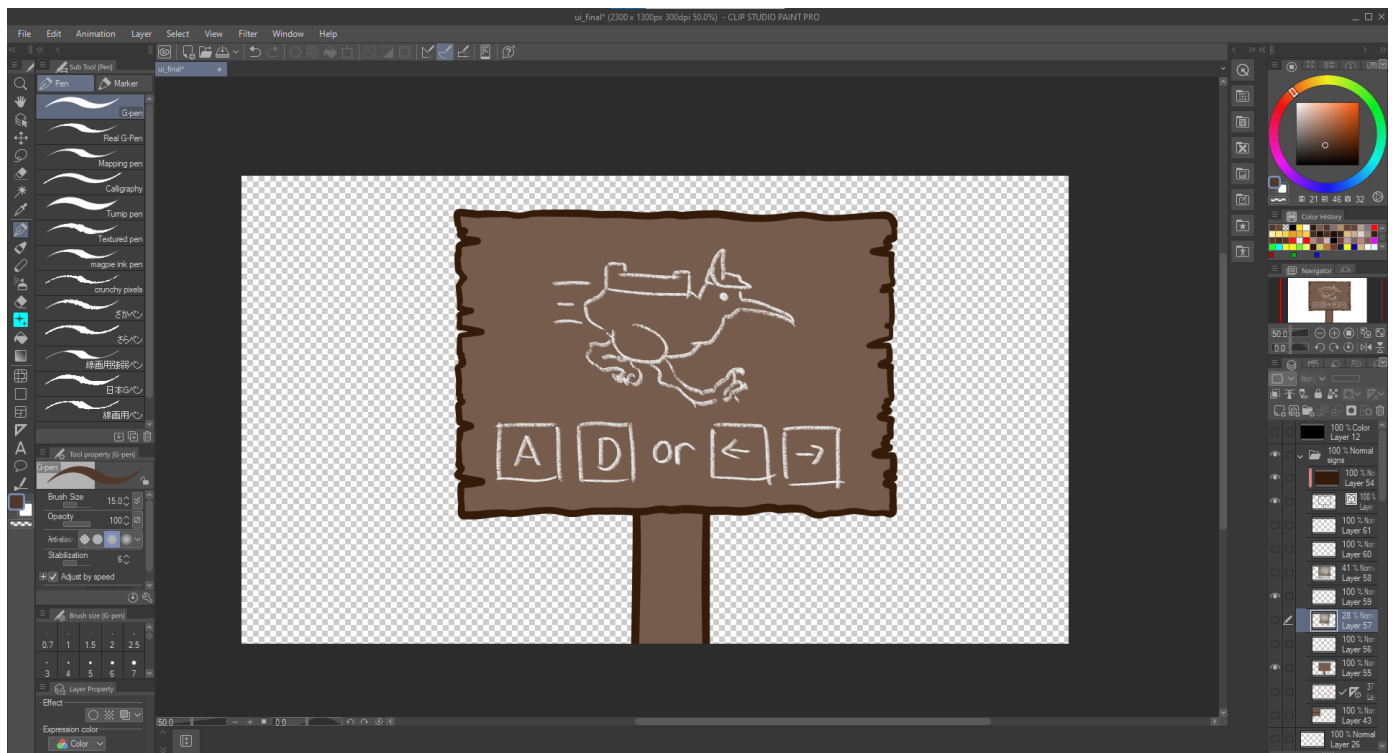

Writing iteration notes based on playtest feedback

Adjusting level complete UI to be centered vertically

Illustrating UI assets based on existing layouts

Illustrating level signage (illustrations on signs are made by tracing over Clarissa's sketches)

Implemented platform jumps for level 2 with water placed in between each platform

Name: Clarissa Chamberlain

Role(s): Artist & Audio Developer

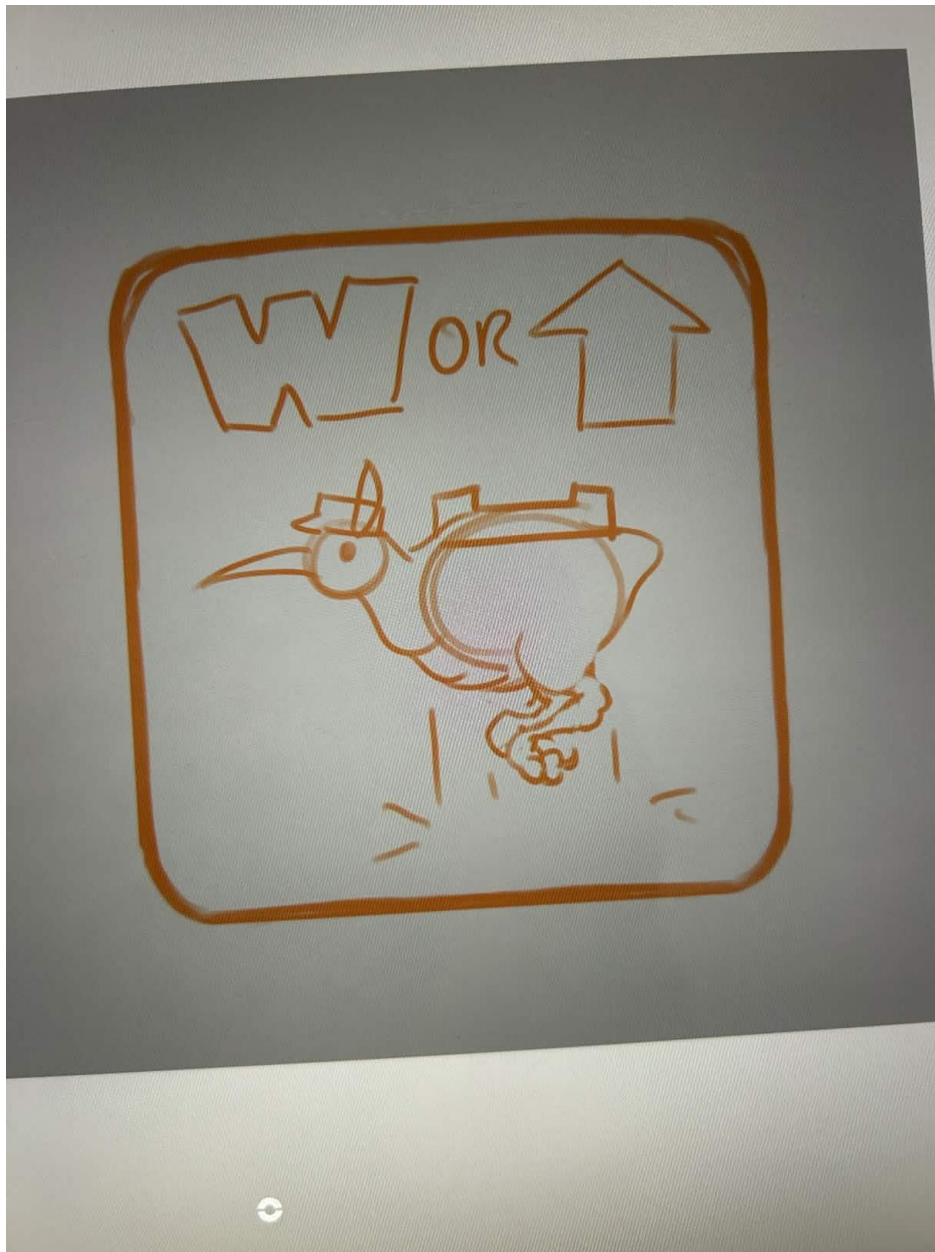

Primary responsibility for this work: To find and edit music and sounds to be implemented in-game and to help create more visual assets for the game.

Goal of Work Session:

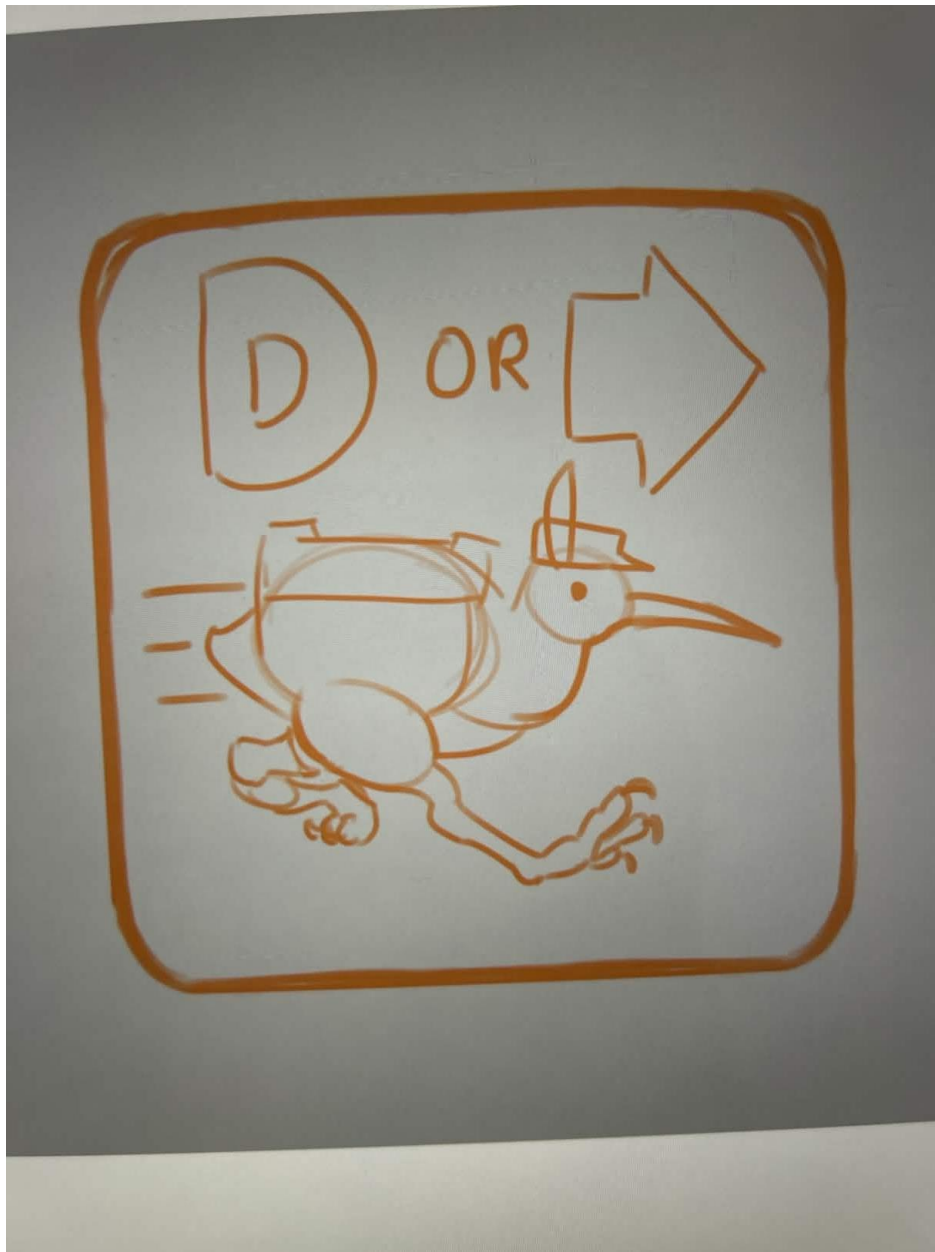

- To find new sounds that could be used in game
- To edit those sounds to make them fit better into the game environment
- To create new visual assets and polish old ones

Tools, Resources, or Inputs Used:

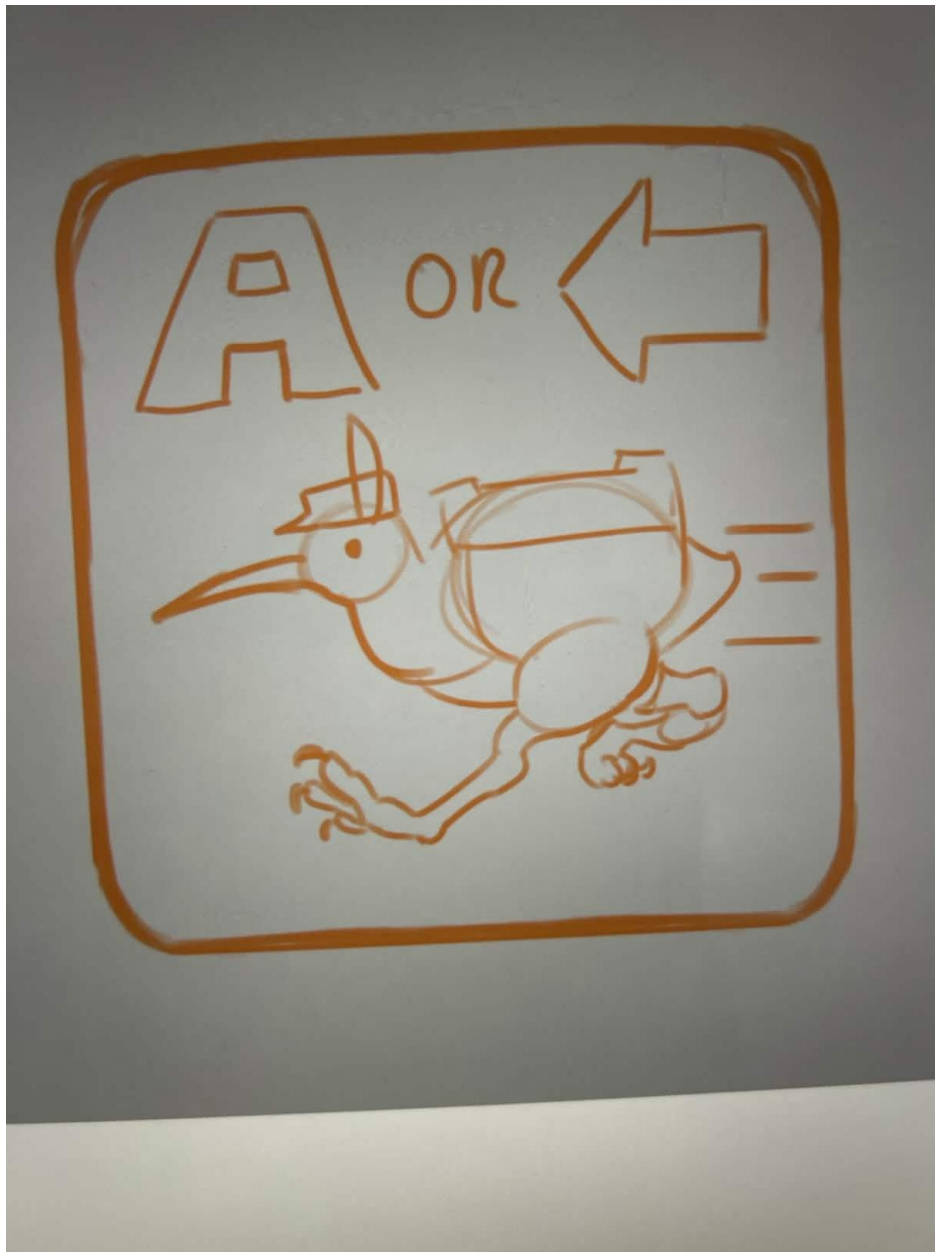

- Sketchbook
- Freesound.org
- Microsoft Word
- Davinci Resolve

Original concept sketch for movement tutorial signage. Specifically for the jump input.

Original Concept sketch for tutorial signage: movement right.

Original concept for tutorial movement signage: left movement.

Originally, I wanted to include these pop-ups that would be at the start of the level, but the use of wooden signs was a better fit thematically, so those were used instead.

In-Game design for the packages. This is the final product that was used in-game.

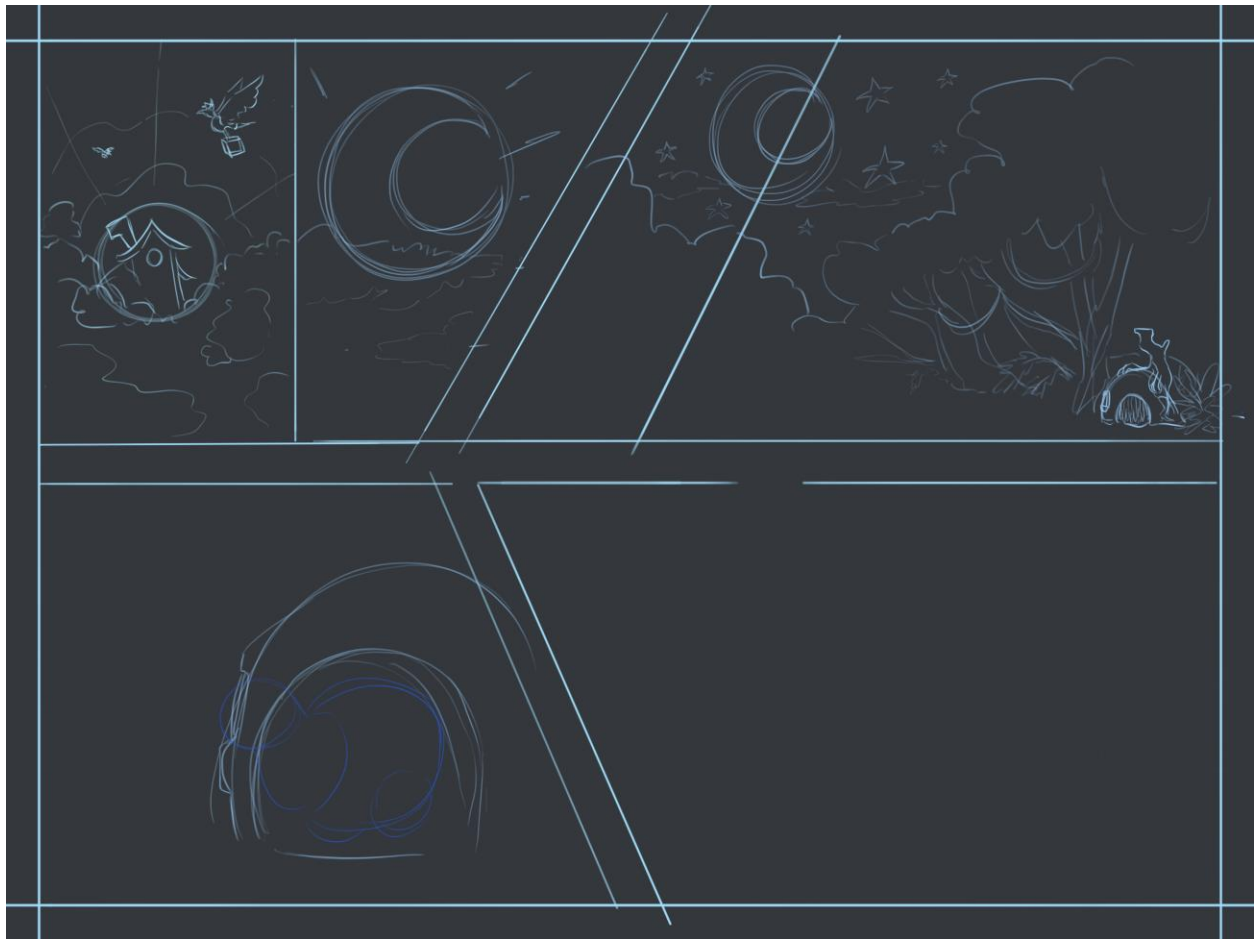

Background art for winter level. This was the final product used in-game. Made in Sketchbook.

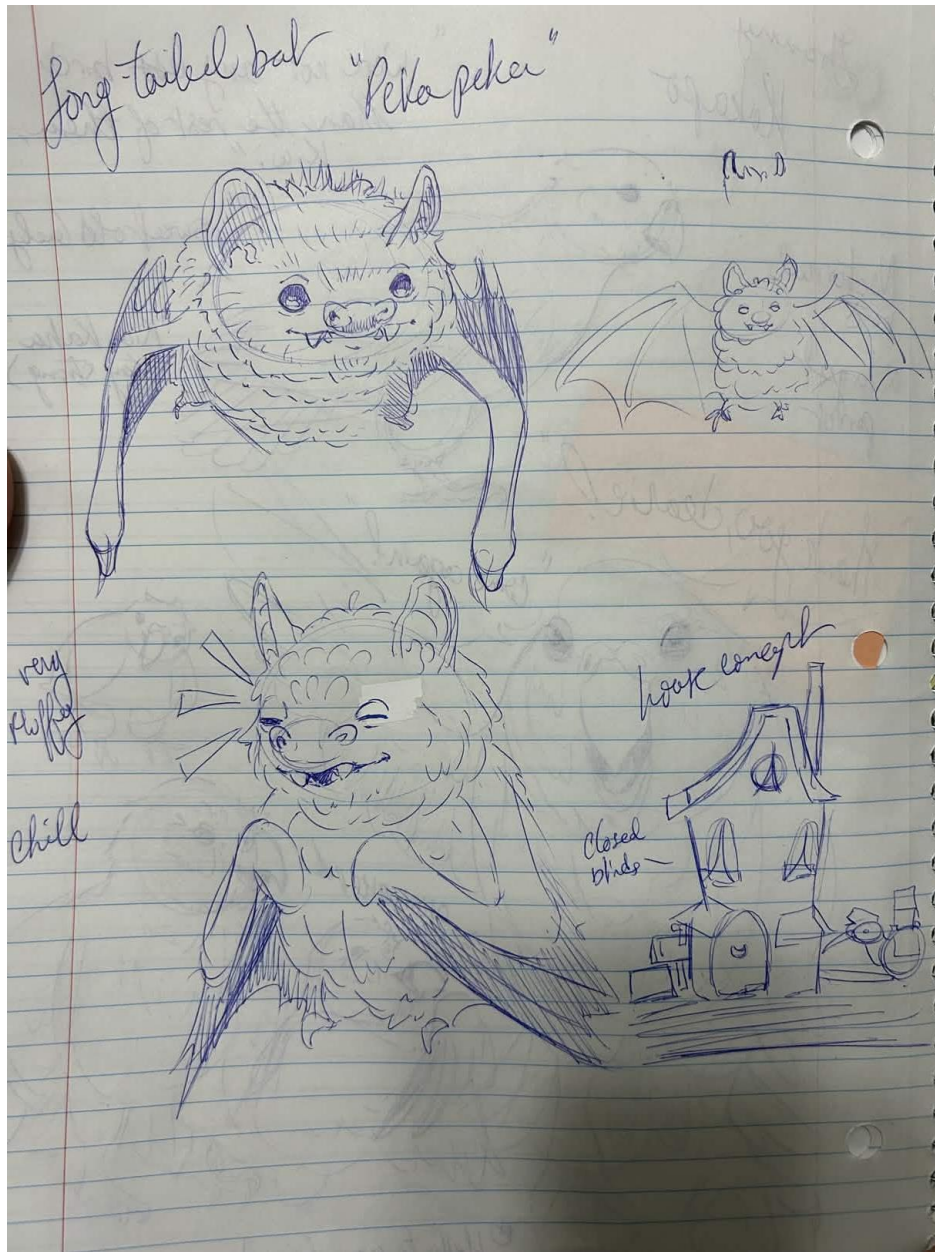

This was the original ice texture drawing. This was later edited by Anna to be more consistent and to function better as a pattern.

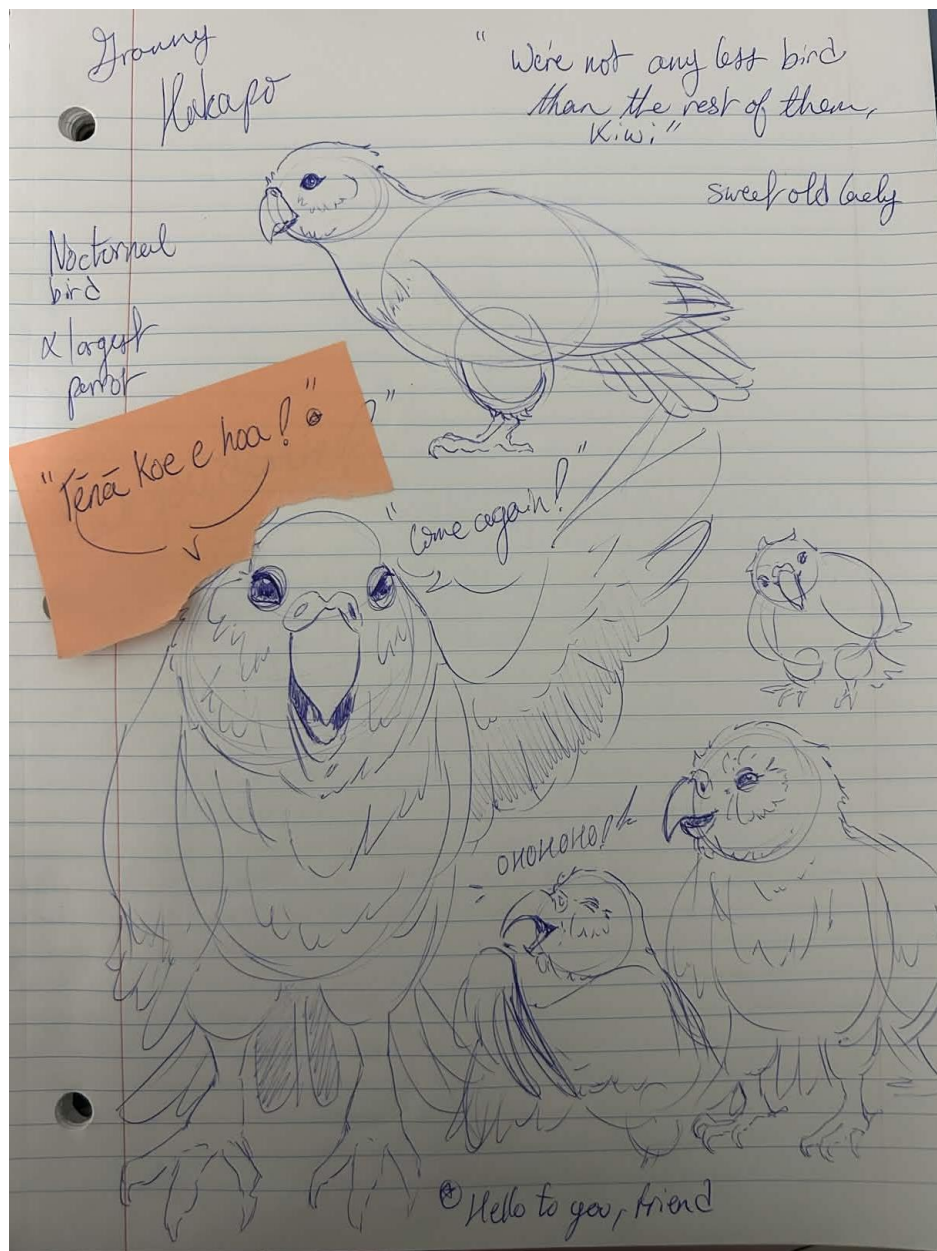

Original work-in-progress sketch for the second house. This design was used in-game but needed to be coloured in and outlined. Made in Sketchbook.

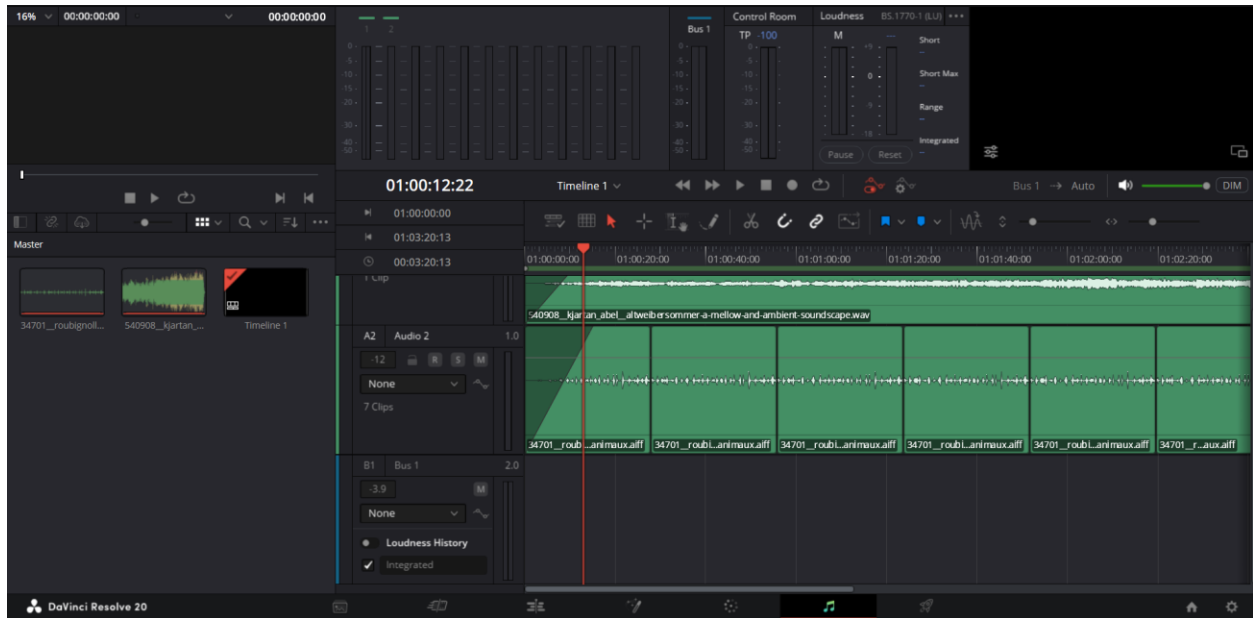

Original concept sketch for introductory comic. This was an idea made by Alex and I, where the comic would introduce the comic through different panels that would appear one at a time. This idea was not implemented due to time constraints. Maybe it could be included in a future version? Made in Sketchbook.

Peka-Peka Character design: This was part of the original concept of the game development where we wanted each house to have a recipient who would speak to Kiwi and have their own animations and responses when the package was delivered. This design was based on the New Zealand Lesser Short Tailed Bat. This design did not make it into the final game. Made with Pen on paper. [8] [9] [10]

Original character design: Kakapo. This was another character concept that was not implemented into the game. This character was based on the Kakapo, another nocturnal, flightless New Zealand bird. The Māori text was translated using a Māori translator. Made with Pen on paper. [7] [8] [9] [10]

Editing process for background music and sounds. Used a loop of ambient wildlife noises on free music made with free sound. Outside of adding a fade at the beginning and end of the track, no major adjustments were made.

Assets Used:

GenAI Documentation

Name: Zain Jafrani

Date Used: April 1st 2026

Tool Disclosure: VS Code Claude agent

Tool name + model/version: Claude Haiku 4.5

Purpose of Use: Understand meanings of each character in levelData.json

Why you used GenAI: Understanding what each letter character represented in levelData.json and how it affected the game level structure

Summary of Interaction: The tool briefly explained what each character in levelData.json did and how it shaped the environment of the game level.

Human Decision Point(s): Since the GenAI was simply giving instructions on how to use the characters to design the level structure, the only decision point for me was deciding whether to reject the output or not.

Integrity & Verification Note: I verified the output of genAI by modifying parts of the code to see what effect it had on the level design and structure. I did this by changing and adding certain characters based on what I wanted the level to look like.

Scope of GenAI Use: GenAI did not contribute directly to the code, was used primarily to help understand what I needed to change to design levels

Summary of Process (Human + Tool): Based on the GenAI output, I started with small scale changes to the levels by adding some water and some floating platforms. After getting more comfortable with the basics of how to change the level environments, I started making more large-scale changes to really differentiate each level and make them slightly more challenging from the previous levels.

Decision Points & Trade-offs Describe one or two key decisions you made:

Key Decision 1: Decision to use GenAI to explain parts of the code and what they mean

Upon working on the levels for our game, I realized I did not understand what each letter/character meant and decided to consult with the built-in GenAI agent to help me understand what each of the characters meant and how it affected the level design and how it looked. While I was deliberating what to do, initially I had the idea to look through the code without assistance from GenAI but then realized how long it would take on an individual scale given the amount of code that we had and since the playtest was at that point only a day away and the urgency to get the levels done before the final playtest, I decided to use the GenAI to help me understand the purpose of the characters in the levelDesign and how they affected the game.

Verification & Judgement:

I evaluated my decision by taking the suggestions of the GenAI into account to guide my level design and then seeing those changes reflected in the game via the previews to see what changes I was making to properly assess the accuracy and validate my decision.

Limitations, Dead Ends, or Open Questions:

No significant limitations with the GenAI's output, found it to be concise and simple to understand and implement into the code

Appendix

Prompt (Zain): what does each letter mean on tileSet

GenAI Output:

☒ **TileSet Character Guide**

Here's what each letter means in tileSet:

Example: In Level 2's tileSet, S marks where the player starts, o is where they deliver, and gggg is the platform they jump on.

Character	Type	Description
g	Ground	Solid walkable terrain with grass texture
d	Dirt	Solid terrain below ground (decorative)
p	Platform	Thin solid platform (unused in current levels)
_	Lilypad	Small platform, SeaGreen color
n	One-Way Platform	Special platform (teal, moves when player is below)
S	Player Start	Where the player spawns (invisible in-game)
o	Post Office	Package delivery destination
r	Recipient	Objective/item to pick up
w	Water	Visual water tile (blue, non-solid)
T	Tree	Background tree decoration (in backgroundTileSet only)
(space)	Empty	No tile, just empty space
